Lactose metabolism in Lactobacillus bulgaricus: analysis of the primary structure and expression of the genes involved.";
J. Bacteriol. 173:1951-1957(1991).
II. CATALYTIC ACTIVITY: Hydrolysis of terminal, non-reducing beta-D-galactose residues in beta-D-galactosides.
II. SUBUNIT: Monomer.
II. SIMILARITY: Belongs to family 2 of glycosyl hydrolases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

-!- PATHWAY: Biosynthesis of diaminopimelate and lysine from aspartate semialdehyde; fourth step.
-!- SUBUNIT: Homotrimer.
-!- SUBCELLULAR LOCATION: Cytoplasmic.
-!- SIMILARITY: BELONGS TO THE CYSE/LACA/LEXA/NOBL FAMILY OF ACETYLTRANSFERASES. COMPOSED OF MULTIPLE REPEATS OF [LIV]-G-X(4).
                                                                                                                                                                           Binder D.A., Blanchard J.S., Roderick S.L., "Crystallization and preliminary crystallographic analysis of tetrahydrodipicolinate-N-succinyltransferase.";

-!- CATALYTIC ACTIVITY: UDP-N-acetyl-D-glucosamine + { (1,4) - (N-acetyl-beta-D-glucosaminyl) } (N) = UDP + { (1,4) - (N-acetyl-beta-D-glucosaminyl) } (N+1).
-!- SUBCELLULAR LOCATION: Plasma membrane-bound.
-!- SIMILARITY: Belongs to the chitin synthase family.
                                                                                                                                     STRAIN=NRRL 1555;

TISSUE SPECIFICTY: LIVER AND SMALL INTESTINE. ALSO FOUND IN
TISSUE SPECIFICATY: LIVER AND SMALL INTESTINE. ALSO FOUND IN
VARY, TESTIS AND KIDNEY.

DISBASE: Defects in MTP are the cause of abetalipoproteinemia
(ABL), an autosomal recessive disorder of lipoprotein metabolism.
Affected individuals produce virtually no circulating
apolipoprotein B-containing lipoproteins (chylomicorons, VLDL,
LDL, lipoprotein(A)). Malabsorption of the antioxidant vitamin E
occurs, leading to spinocerebellar and retinal degeneration.
SIMILARITY: TO VITELLOGENINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      MICROSOMAL TRIGLYCERIDE TRANSFER PROTEIN, LARGE SUBUNIT.
                                                                            associated with plasma cholenterol levels and body mass index."; J. Lipid Res. 43:51-58 (2002).
-1- FUNCTION: CATALYZES THE TRANSPORT OF TRIGLYCERIDE, CHOLESTERYL ESTER, AND PHOSPHOLIPID BETWERN PHOSPHOLIPID SYRRACES. REQUIRED FOR THE SECRETION OF PLASMA LIPOPROTEINS THAT CONTAIN

Polymorphisms at the Werner locus: I. Newly identified polymorphisms,
ethnic variability of 1367Cys/Arg, and its stability in a population
of Finnish centenarians ",
Am. J. Med. Genet. 82:399-403(1999)
I. FUNCTION: Essential for the formation of DNA replication focal
centers; stably associates with foci elements generating binding
sites for RP-A. Exhibits a magnesium-dependent ATP-dependent halicase activity. May be involved in the control of genomic
stability (By similarity).
I. SUBCELLUIAR LOCATION: Nuclear; nucleolar.
                                                                                                                                                                                                                                             DISEASE: Defects in WRN are the cause of Werner syndrome (WS)
[MIM:277700]. WS is a rare autosomal recessive progeroid syndrome characterized by the premature onset of multiple age-related disorders, including atherosclerosis, cancer, non-insulin dependent diabetes mellitus, ocular cataracts and osteoporosis. The major cause of death, at a median age of 47, is myocardial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    2 X 27 AA TANDEM REPEATS OF H-L-S-P-N-D-

Rubin G.M., RESEARCHO800.1-RESEARCH080.8 (2002).

-I- FUNCTION: Proteolytically removes the C-terminal three residues of farnesylated and geranylated proteins (By similarity).

-I- SUNCELLUIAR LOCATION: Integral membrane protein. Endoplasmic

reticulum (By similarity).

-!- FUNCTION: NDH-1 shuttles electrons from NADH, via FMN and ironsulfur (Fe-S) centers, to quinones in the respiratory chain.

Couples the redox reaction to proton translocation (for every two electrons transferred, four hydrogen ions are translocated across the cytoplasmic membrane), and thus conserves the redox energy in a proton gradient (By similarity).

-!- CATALYTIC ACTIVITY: NADH + quinone = NAD(+) + quinol.

-!- SIMILARITY: Belongs to the complex I 49 kDa subunit family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            16-OCT-2001 (Rel. 40, Created)

-!- FUNCTION: NDH-1 shuttles electrons from NADH, via FMN and iron-
sulfur (Pe-S) centers, to quinones in the respiratory chain. The
immediate electron acceptor for the enzyme in this species is
believed to be ubiquinone. Comples the redox reaction to proton
translocation (for every two electrons transferred, four hydrogen
conserves the redox energy in a proton gradient (By similarity).
-!- CATALYTIC ACTIVITY: NADH + quinone = NAD(+) + quinol.

  Delivery systems with improved delivery into target cells, half-life, solubility in biological fluids, enhanced metabolism, biodistribution and excretion, and minimal toxic side-effects.
   This invention relates to novel drug delivery systems comprising a drug group linked to a carrier group comprising a homeobox peptide, its fragment or derivative. The invention may provide a method of improved delivery into target cells with enhanced metabolism, biodistribution and excretion of a drug. The drug may be therapeutically active in both intact and dissociated states. The invention may improve half-life of a drug in human or animal bodies, improve solubility in biological fluids, manimise known toxic or non-desirable side-effects, enhance onset of action of a desired therapeutic effect, provide alternative routes for administration of drug and decrease incidence of drug resistance. The present sequence is the amino acid sequence of a carrier peptide derived

The invention discloses peptides comprising deltaV1-1, deltaV1-2, pseudodelta receptors for activated C-kinase (RACK), deltaV1-5 or their chartaives or fragments. Protein kinase C (PKC) is a key enzyme in signal transduction involved in a variety of cellular functions including cell growth, regulation of gene expression and ion channel activity. The coll growth, regulation of gene expression and ion channel activity. The coll growth, regulation of dene extracted isozymes to the specific current appears due to binding of the activated isozymes to the specific anchoring molecules (RACKs). Peptides that mimic either the PKC-binding cit in mibitions of PKC. The disclosed peptides are useful in activating or inhibitions translocation or function of deltaPKC. The disclosed peptides are useful in activating or inhibitions of PKC. The disclosed peptides are useful in activating or inhibitions of solls or tissues due to ischaemic or hypoxic colls caused by stroke. Admage to cells or tissues due to ischaemic or hypoxic event caused by stroke. The against damage to cells or tissues due to ischaemic or hypoxic event caused by stroke. The derived peptide, protected hearts against ischaemic damage as shown by decreased release of creatine kinase. The cata indicate that in an intact heart, inhibition of deltaPKC conferred cata indicate that in an intact heart, inhibition of deltaPKC conferred conferred conferred is the Drosophila antennapedia homedomain-derived carrier peptide, which was used to facilitate transport of the rat delta protein kinase C (PKC) agonists or antagonists across the cell membrane. (Updated on 06-AUG-2003 to correct OS field.)
  Drosophila antennapedia homeodomain-derived carrier peptide SEQ ID NO:12.
  New delta protein kinase C peptide for reducing or enhancing damage to cells or tissues exposed to ischemic or hypoxic event caused by stroke, or for protecting tissue from damage due to ischemia.

The specification describes pseudopeptide compounds. These compounds are inhibitors of routes activated by proteins having a tyrosine kinase scivity. The compounds also have high affinity for a growth factor receptor binding protein (Grb2). The pseudopeptide compounds are used for the treatment of disorders of proliferative processes, cancers, and metastases. The present sequence is derived from the antennapaedia protein, and is a fragment of the pseudopeptide compounds of the
  Peptide detection; pBLOCK-1; biological interaction; bacterial protein; modulator identification; oncoprotein; leukaemia; solid tumour; therapy;
  Detecting peptides that modulate biological interaction, for identifying antibacterial peptides and antitumor agents.
  Pseudopeptides, useful for the treatment of proliferative process disorders, cancers, and metastases, inhibit paths activated by proteins with a tyrosine kinase activity.
   This sequence represents the Drosophila penetratin motif. The invention relates to a method for identifying a (oligo) peptide or polypeptide (I) able to modulate a biological interaction (BI) in a host cell by producing a peptide library in transformed cells that include: (i) a nucleic acid (NI) comprising, or encoding, a reporter molecule, the expression of which is under control of BI; and (ii) a second sequence (N2) that encodes (I), under control of a promoter. The cells are cultured to express N2, then any cells in which expression of the

   The present invention describes a telomerase inhibitory peptide (TEIPP). TEIPP is derived from human telomerase reverse transcriptase (hTERT). TEIPP has cytostatic activity, and can be used as a telomerase inhibitor. The TEIPP peptide is useful for treating or preventing cancer and other proliferative disorders, for inducing cell death or cell proliferation, and for inhibiting cell growth. The present sequence represents a Drosophila antennapedia homeodomain-derived carrier peptide, which is used in an example from the present invention

Identifying a modulator or mediator of antigenicity and/or immunogenicity useful as vaccines or agents for immunotherapy of allergic or autoimmune disease, by using biodiverse gene fragment libraries. Disclosure; Page 49; 96pp; English.

The present sequence may be fused to a protein in order to assist penetration or uptake of the protein. The sequence is given in a specification relating to a method for identifying a modulator or immediator of a biological activity such as antigenicity and/or immunogenicity. The method comprises producing a gene fragment expression library from defined nucleotide sequence fragments and assaying the library for an amino acid sequence for a biological activity that is different from any activity the amino acid sequence has in its native environment. The identified modulators are useful as vaccines or agents for immunotherapy of allergic or autoimmune disease, antibiotic or .nhibitory agents

oxidized and cleaved to form an oligomeric compound having a reactive sulfur moiety. The reactive sulphur moiety is reacted with peptide with functional group reactive with sulfur moiety, to form a peptide with confine an oligomeric compound. The method of the invention is useful for preparing compounds. The oligomeric compounds can be used in also be used in pharmaceutical and as research reagents and kits. They can also be used in pharmaceutical compositions by including a suitable of diagnostics, tracting organisms having a disease characterised by the undesired production of a protein. This method is suitable for large cudesized production of a protein. This method is suitable for large scale synthesis of oligomeric compounds, the methods provide improved synthesis of oligomeric compounds, the methods is useful in a synthetic schemes which avoid the problem of prior art. The synthetic methods employed equimolar amounts of functionalised oligomeric compounds of synthesis. This scaled up synthesis is significantly larger than any synthesis method described previously. The methods are highly economical. The present sequence represents a peptide used in the creation of a peptide lik=nked oligomeric compound of the invention

This sequence represents a Drosophila antennapoedia homeobox domain peptide (pAntp), involved in transcellular localisation. PAntp can be fused to Cytochrome P450 reductase (P450R) derivatives such as anchorless P450R (AAV42287) or EN fragment (AAV42288). This enables the fusion to P450R (AAV42287) or EN fragment (AAV42288). This enables the fusion compared to other cells where it is then transported to the nucleus. Many drugs' sites of action are in the nucleus, rather than the cytoplasm, where P450R normally functions. P450R or its derivatives can be used to activate prodrugs to their active form via reduction. Complexation of a prodrug is useful where the active drug may be complexed before it reaches its site of action or where the active drug is cytotoxic, e.g., anticancer drugs. Targetted delivery of such prodrug complexed to the condition of a prodrug in dose of the prodrug, and thus of activators allows a reduction in dose of the prodrug, and thus of systemic side-effects. P450R derivative fusion proteins, or vectors that express them, are specifically used to treat tumours, inflammation, cappered many other conditions, e.g., cerebral malaxia, rheumatoid arthritis, or conditions associated with hypoxia, ischaemia or hypoglycemia, or to deliver antibiotics, antiviral agents and diagnostic agents Sequence 60 AA; 88888888888888888888888888

New conjugate comprising a homeodomain of Antennapedia - useful for prevention or treatment of cancer, geriatric diseases and bacterial or viral infections

Example 1; Page 42; 45pp; English.

The present invention describes a conjugate comprising: (i) a first region comprising the homeodomain of antennapedia or a variant; and (ii) a second region not naturally associated with the first non-denatured region. The conjugate is useful in an expression system, and in pharmaceutical compositions e.g. vaccines for prevention or treatment of cancer, geriatric diseases, and bacterial or viral infections. It is also useful in gene therapy, protein sorting and for DNA synthesis. The

activity). A method is also described for reducing bacterial lipopolysaccharide-induced nuclear translocation of NF-kB in eukaryotic cells by inhibiting: (a) modification of new protein, IRB, which reduces binding to NF-kB; (b) degradation of IRB, or (c) dissociation of NF-kB-ccells. The products of the invention have virucide and artibacterial activity. The method is useful to inhibit expression of genes whose transcription is regulated by NF-kB, especially in mammalian (preferably chuman and especially immune or lymphoid) cells. It can be used to reduce expression of viral genes (e.g. cytomegalovirus, human immunodeficiency virus or simian virus 40 genes, especially to reduce the effects of viral captesions on mammalian cells. It is also useful to reduce expression of cytokine genes or bacterial lipopolysaccharide-induced genes to reduce effects of bacterial lipopolysaccharides and/or bacterial infection on mammalian cells. It is also useful to reduce expression of cytokine genes or bacterial lipopolysaccharides and/or bacterial infection on lammalian cells. Genecially immune cells). For example, bacterial clipopolysaccharides and/or bacterial collaboratide deviced expression of cytokines or tumor necrosis (actor-alpha may be reduced expression of cytokines or tumor necrosis clipopolysaccharides during infection. The method of inhibiting expression in a mammalian cell of a gene whose transcriptional activity is activated by binding of NF-kB to the gene, comprises introducing a nucleic acid decoy modicule into the cell in an amount which is sufficient to inhibit expression of expression of the gene, the decoy contains a NF-kB binding site that binds to NF-kB. This sequence is used to illustrate the method described contains in the disclosure of the invention

The present invention relates to a new method for assessing whether a control is afflicted with ovarian cancer. The method involves comparing the expression of the marker in a control non-ovarian cancer sample, where conference is selected from 363 cancer markers described in the specification. The method of the invention is useful in diagnosing or characterising cancer, in detecting the presence of cancer as early as consible, and the recurrence of ovarian cancer. The method may also be of particular use with patients having an enhanced risk of developing concer, (e.g. patients having an enhanced risk of developing concern (e.g. patients having an enhanced risk of developing cancer.) The cancer markers may be used in the management and treatment cancer. The cancer markers may be used in the management and treatment of e.g. brain and central nervous system disorders (e.g. bacterial and viral meningitis, Allaheimer's disease or Parkinson's disease), brain disorders (e.g. bacterial or viral meningitis or encephalitis), connective tissue disorders (e.g. nortuberculous grannlomatous orchitis), connective tissue disorders, or heart disorders (e.g. ischaemic heart disease or atherosclerosis). The compositions and methods may also be used in assessing the histological type of neoplasm associated with evaluan cancer has metastasized or is likely to metastasize, whether ovarian cancer has metastasized or is likely to metastasize, selecting a composition for inhibiting ovarian cancer, assessing the concern or at risk of developing ovarian cancer. The present amino acid in the including ovarian cancer terpresents one of the ovarian cancer markers described in the ovarian cancer represents one of the ovarian cancer in the program cancer. The present amino acid in the including ovarian cancer markers described in the
           Assessing whether a patient is afflicted with ovarian cancer, useful in assessing the stage or progression of the disease, comprises comparing the expression level of a cancer marker in a sample from a patient and

The present sequence is that of new human protein regulating gene expression PRGE-3. It was deduced from Incyte clone 996352 obtained from a kidney tumour cDNA library. PRGE-3 is characterised as a homeodomain protein. It is expressed in reproductive, cardiovascular and urologic tissues associated with cancer and trauma diseases, disorders or conditions. The invention provides PRGE polypeptides (see AAY5868-38) and polynucleotides (see AAZ57839-69), expression vectors, host cells, antibodies, agonists and antagonists. It also provides methods for diagnosing, treating or preventing disorders associated with expression of PRGE

The invention relates to a new drug delivery construct comprises at least one transport agent region and an active agent region. The transport agent region able to facilitate the upcake of the active agent region is an active therapeutic agent region able to facilitate axon growth and an analogue. The drug delivery construct is useful for suppressing the inhibition of neuronal axon growth, tracting axon growth, tracting nerve injury, treating and the drug conjugate are useful for the manufacture of a pharmaceutical composition for treating nerve injury. The drug delivery construct composition for treating nerve injury. The invention is useful in gene therapy. The present sequence is C3APL protein comprising ADP-ribosyl transferase C3 protein and antennapedia protein

   The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from NIPO at ftp.wipo.int/pub/published_pct_sequences

   The specification describes pseudopeptide compounds. These compounds are inhibitors of routes activated by proteins having a tyrosine kinase activity. The compounds also have high affinity for a growth factor receptor binding protein (Grb2). The pseudopeptide compounds are used for the treatment of disorders of proliferative processes, cancers, and metastases. The present sequence is derived from the antennapaedia protein, and is a fragment of the pseudopeptide compounds of the

The specification describes pseudopeptide compounds. These compounds are inhibitors of routes activated by proteins having a tyrosine Kinase activity. The compounds also have high affinity for a growth factor receptor binding protein (Grb2). The pseudopeptide compounds are used for the treatment of disorders of proliferative processes, cancers, and metaatases. The present sequence is derived from the antennapsedia protein, and is a fragment of the pseudopeptide compounds of the
   /note= "in determining the ability of this sequence to be internalised in cells, a biotin-aminopentanoyl group was attached to the N-terminal"

New nucleic acid for treating diseases, e.g. cancer, autoimmune disease, cardiovascular disease or AIDS, comprises a secretable RNA polymerase expression cassette having a eukaryotic promoter and an RNA polymerase promoter

Claim 5; Page 4; 65pp; English.

The invention relates to autogene nucleic acids encoding secretable RNA polymerases. The invention also relates to methods, nucleic acids, compounds and compositions for expressing a product of interest in a cell that involve a secretable RNA polymerase. The nucleic acid is useful in treating a disease, e.g. cancer, an autoimmune disease, arthritis, a cardiovascular disease, cystic fibrosis, an infectious disease, sickle

```
The specification describes a lipid-nucleic acid complex, comprising a compacted nucleic acid, a polycation, a targeting factor and a lipid, but not a protamine. The targeting factor increases cellular bloavailability of the nucleic acid without interaction with a specific outer cell surface membrane receptor. The mean diameter of the complex is greater than 100 nm and less than 400 nm. The lipid-nucleic acid complex is useful for delivering a nucleic acid to a cell in vivo, e.g. for gene therapy. It reduces levels of inflammatory cytokines such as tumour necrosis factor-alpha. The complex is useful for manufacturing a necrosis factor-alpha. The complex is useful for manufacturing a conficement for treating or diagnosing a variety of diseases, conditions or syndromes such as cancer, bacterial, viral or parasitic infections, immune deficiencies, gene defects, and gene deficiencies (e.g. inherited genetic diseases). The present sequence represents a membrane translocating peptide, which is used as the targeting factor in lipid-nucleic acid complexes of the invention
   Lipid-nucleic acid complex useful for delivering a nucleic acid to a cell, comprises compacted nucleic acid, polycation, targeting factor and lipid, and does not comprise protamine or its salt.

  Penetratin is a membrane translocation polypeptide and as such, active peptide fragments of penetratin can be used to translocate conjugated molecules across the cell membrane e.g. drugs. 13 chemical entities are described for use in membrane as paclitaxel-succinimidopropionoyl-CbetaA-RRMKWKK-NH 2, and podophyllotoxin-4-succinimidopropionoyl CbetaA-RRMKWKK-NH 2. The method has applications as a drug delaivery system for treatment and therapy. The resulting conjugated molecules exhibit high immunogenicity, solubility and clearance. The penetratin peptide fragment may be truncated and or have amino acid substitutions. See GENESEQ records AAY83520-Y83581

The present invention relates to novel peptides comprising of a specific tetrapeptide associated with an oligopeptide which allows the introduction of the tetrapeptide into the target cell. The present sequence is one such peptide. The specific cell. The present at position 1 corresponds to the specific tetrapeptide, while residues 1 to 17 corresponds to the oligopeptide. The specific tetrapeptide of the present sequence interferes with alpha smooth muscle (alpha-SM) actin organisation in stress fibers. The present sequence may be used in the prevention and/or treatment of a disease related to alpha-SM actin expression, e.g. wound contraction, hypertrophic scars, fibromatosis and bubuytren disease and lung fibrosis. Note: the present sequence is not shown in the specification but is derived from information given by the

Penetratin is a membrane translocation polypeptide and as such, active peptide fragments of penetratin can be used to translocate conjugated molecules across the cell membrane e.g. drugs. 13 chemical entities are described for use in the method such as paclitaxel-2's confinidopropionoyl-CbetaA-RRMKWKK-NH 2, and podophyllotoxin-4-succinimidopropionoyl CbetaA-RRMKWKK-NH 2. The method has applications as a frug delivery system for treatment and therapy. The resulting conjugated molecules exhibit high immunogenicity, solubility and clearance. The penetratin peptide fragment may be truncated and or have amino acid substitutions. See GENESEQ records AAY83520-X83581

Peptides comprising membrane transiting peptides useful for treating or preventing a virus infection, e.g., human immunodeficiency virus, herpes simplex virus and cytomegalovirus.

Claim 7; Page 15; 43pp; English.

The invention relates to peptides comprising membrane transiting peptides with antiviral properties. The peptides are useful for treating or preventing a virus infection in a warm blooded animal, e.g., enveloped viruses such as human immunodeficiency virus (HIV), herpes simplex virus (HEV), cytomegalovirus (CWV) and non-enveloped virus. Preferably, the peptides are useful for treating or preventing infections from one or more HSVs. The antiviral peptides are used for treating viral infections of the skin or part of the oral or genital cavity. The present sequence is membrane transiting antiviral peptide

ö Fusion agent useful for preventing and treating an infectious disease, a proliferative disease, such as cancer, comprises a transport domain, two cleavage sites, a peptide epitope and a biologically active agent.

Claim 9; Page 14; 72pp; English

The invention relates to a fusion agent (Trojan antigen; TA) comprising a transport domain, two cleavage sites, a peptide epitope recognised by an antigen-specific receptor on an effector T-lymphocyte precursor cell and a biologically active agent, where there is a cleavage site between the peptide epitope and the biologically active agent and between each biologically active agent. The fusion agent is used to make a cell

```
The invention relates to a collection of polypeptides comprising two polypeptides (referred to as an adaptein library) each of which has a fragment of amino acids 119-275 of Venezuelan equine encephalitis virus capsid polypeptide carboxy terminal portion (ABU0976, also known as cabid by Dypeptide carboxy terminal portion (ABU0976, also known as cids 129-137, Merer at least two consecutive amino acids within amino acids 129-137, 182-189, 257-264 of CCD are replaced by a variant amino acids 129-137, 182-189, 257-264 of CCD are replaced by a variant amino acids sequence. Also included are a population of cells comprising two or more cells (where each member of the population comprises one polypeptide of an adaptein), a fusion protein chosen from an adaptein fused to a cell permeant peptide, a cell comprising the fusion protein, a collection of polymucleotides (comprising at least two polymucleotides, each polymucleotide comprising a coding sequence encoding a polypeptide comprising an adaptein), a vector comprising a member of the polymucleotide collection, a population of cells comprising two or more

This invention relates to a novel method of immunoregulation, specifically T cell response regulation by enhancing the immune response with 4-1BB binding agents. 4-1BB (also known as CD137) is a member of the tumour necrosis factor (TMF) receptor family, and is expressed on the surface of activated T-cells. Administration of a 4-1BB binding agent and a tumour specific immunogenic stimulus has been found to result in the regression of that tumour. The binding agent can be an antibody that thereof), whereas the immunogenic stimulus is either a tumour associated thereof), whereas the immunogenic stimulus is either a tumour associated peptide fragment or a molecule produced by an infectious microorganism of e.g. a retrovirus or protozoan parasite. As such, the present invention describes a method of gene therapy for the treatment of, for example, clenkaemia, astrocytomas, colon cancer, testicular cancer, bone and clenkaemia, astrocytomas, colon cancer, testicular cancer, bone and provide a therapy or prophylaxis for various infectious diseases.

Cu vascular tumours: In addition, with an appropriate immunostimulant it can provide a therapy or prophylaxis for various infectious diseases.

Cu depression in immunological function), and can also reverse established anergy (a depression in immunological function), and can also reverse established can mergy, in CD84 T-cells T-cells peptide sequence is the antennapedia chomecodomain peptide that acts to direct proteins, such as the immunostimulant or 4-1BB binding agents, to specific cellular compartments, the method of the invention
   Generating an enhanced immune response in a subject comprises administering to the subject an immunogenic stimulus (e.g. a tumorassociated antigen) and an agonistic 4-1BB-binding agent (e.g. antibody

   The specification describes pseudopeptide compounds. These compounds are inhibitors of routes activated by proteins having a tyrosine kinase scitvity. The compounds also have high affinity for a growth factor receptor binding protein (Grb2). The pseudopeptide compounds are used for the treatment of disorders of proliferative processes, cancers, and metastases. The present sequence is derived from the antennapaedia protein, and is a fragment of the pseudopeptide compounds of the

A peptidic product for prevention and treatment of a disease related to alpha-SM actin expression comprises a tetrapeptide associated with a chemical entity that is able to introduce the tetrapeptide into the cell. Claim 7; Page 24; 31pp; English. Scarso A; WPI; 2000-452308/39. 

The present invention relates to novel peptides comprising of a specific tetrapeptide associated with an oligopeptide which allows the introduction of the tetrapeptide into the target cell. The present sequence is one such peptide. The side chain linked to the lysine residue at position 3 corresponds to the specific tetrapeptide, while residues 3 to 19 correspond to the oligopeptide. The specific tetrapeptide of the present sequence interferes with alpha smooth muscle (alpha-SM) actin organisation in stress fibers. The present sequence may be used in the prevention and/or treatment of a disease related to alpha-SM actin expression, e.g. wound contraction, hypertrophic scars, fibromatosis and fibrotic conditions. The present sequence may also be used to treat bupuytren disease and lung fibrosis. The tetrapeptide of the present invention is described in AAB14263.
